

Title: SQL Table Operations

Objective:

To practice basic SQL operations such as creating tables, modifying columns, adding constraints and managing data using SQL commands.

Description:

This project involves creating and modifying two tables—employee and department—in a database.

Key tasks include adding and altering columns, setting primary and foreign keys and performing delete and truncate operations. It helps build foundational SQL skills for managing relational databases.

1. Create a table called employee with the following structure And 2) Allow NULL for all columns except E_ID & E_NAME:

Column Name	Data Type
E_ID	INT
E_NAME	VARCHAR(20)
E_ADDRESS	VARCHAR(20)
D_ID	INT

SQL Queries:

```
CREATE DATABASE lab1;
USE lab1;

CREATE TABLE employee (
  E_ID INT NOT NULL,
  E_NAME VARCHAR(20) NOT NULL,
  E_ADDRESS VARCHAR(20),
  D_ID INT
);
```

Output

	#	Name	Type	Collation	Attributes	Null	Default
<input type="checkbox"/>	1	E_ID	int(11)			No	None
<input type="checkbox"/>	2	E_NAME	varchar(20)	utf8mb4_general_ci		No	None
<input type="checkbox"/>	3	E_ADDRESS	varchar(20)	utf8mb4_general_ci		Yes	NULL
<input type="checkbox"/>	4	D_ID	int(11)			Yes	NULL

3. Add a column joinData (type INT) to the employee table:

SQL Queries:

```
ALTER TABLE employee ADD joinData INT;
```

Output

	#	Name	Type	Collation	Attributes	Null	Default	C
<input type="checkbox"/>	1	E_ID	int(11)			No	None	
<input type="checkbox"/>	2	E_NAME	varchar(20)	utf8mb4_general_ci		No	None	
<input type="checkbox"/>	3	E_ADDRESS	varchar(20)	utf8mb4_general_ci		Yes	NULL	
<input type="checkbox"/>	4	D_ID	int(11)			Yes	NULL	
<input type="checkbox"/>	5	joinData	int(11)			Yes	NULL	

4. Modify the column joinData to VARCHAR(20):

SQL Queries:

```
ALTER TABLE employee MODIFY joinData VARCHAR(20);
```

 Note: In **MySQL**, MODIFY works. In **SQL Server**, use ALTER COLUMN.

	#	Name	Type	Collation	Attributes	Null	Default	C
<input type="checkbox"/>	1	E_ID	int(11)			No	None	
<input type="checkbox"/>	2	E_NAME	varchar(20)	utf8mb4_general_ci		No	None	
<input type="checkbox"/>	3	E_ADDRESS	varchar(20)	utf8mb4_general_ci		Yes	NULL	
<input type="checkbox"/>	4	D_ID	int(11)			Yes	NULL	
<input type="checkbox"/>	5	joinData	varchar(20)	utf8mb4_general_ci		Yes	NULL	

5. Create a table called department with the following structure:

Column Name	Data Type
D_ID	INT (PK)
D_NAME	VARCHAR(20)

SQL Queries:

```
CREATE TABLE dep (  
  D_ID INT NOT NULL PRIMARY KEY,  
  D_NAME VARCHAR(20)  
);
```

Output

	#	Name	Type	Collation	Attributes	Null	Default	C
<input type="checkbox"/>	1	D_ID	 int(11)			No	None	
<input type="checkbox"/>	2	D_NAME	varchar(20)	utf8mb4_general_ci		Yes	NULL	

6. Add a foreign key constraint to D_ID in employee table:

SQL Queries:

```
ALTER TABLE employee  
ADD CONSTRAINT FKEY  
FOREIGN KEY (D_ID)  
REFERENCES dep(D_ID);
```

Output

	#	Name	Type	Collation	Attributes	Null	Default	C
<input type="checkbox"/>	1	E_ID	int(11)			No	None	
<input type="checkbox"/>	2	E_NAME	varchar(20)	utf8mb4_general_ci		No	None	
<input type="checkbox"/>	3	E_ADDRESS	varchar(20)	utf8mb4_general_ci		Yes	NULL	
<input type="checkbox"/>	4	D_ID	 int(11)			Yes	NULL	
<input type="checkbox"/>	5	joinData	varchar(20)	utf8mb4_general_ci		Yes	NULL	

7. Drop the column joinData from the employee table:

SQL Queries:

```
ALTER TABLE employee DROP COLUMN joinData;
```

Output

	#	Name	Type	Collation	Attributes	Null	Default	C
<input type="checkbox"/>	1	E_ID	int(11)			No	None	
<input type="checkbox"/>	2	E_NAME	varchar(20)	utf8mb4_general_ci		No	None	
<input type="checkbox"/>	3	E_ADDRESS	varchar(20)	utf8mb4_general_ci		Yes	NULL	
<input type="checkbox"/>	4	D_ID 	int(11)			Yes	NULL	

8. Truncate the employee table and drop the department table:

Insertion

```
INSERT INTO dep (D_ID, D_NAME)
```

```
VALUES (101, 'HR'),
```

```
        (102, 'Finance');
```

```
INSERT INTO employee (E_ID, E_NAME, E_ADDRESS, D_ID)
```

```
VALUES (1, 'Salim', 'Kathmandu', 101),
```

```
        (2, 'Santosh', 'Surkhet', 102);
```

E_ID	E_NAME	E_ADDRESS	D_ID
1	Salim	Kathmandu	101
2	Santosh	Surkhet	102

SQL Queries:

```
TRUNCATE TABLE employee;
```

E_ID E_NAME E_ADDRESS D_ID

Query results operations

```
ALTER TABLE employee DROP FOREIGN KEY FKEY;
```

#	Name	Type	Collation	Attributes	Null	Default	Cor
<input type="checkbox"/> 1	E_ID	int(11)			No	None	
<input type="checkbox"/> 2	E_NAME	varchar(20)	utf8mb4_general_ci		No	None	
<input type="checkbox"/> 3	E_ADDRESS	varchar(20)	utf8mb4_general_ci		Yes	NULL	
<input type="checkbox"/> 4	D_ID	int(11)			Yes	NULL	

```
DROP TABLE dep;
```

New

information_schema

lab1

New

employee

✓ MySQL returned an empty result set (i.e. zero rows). (Query took 0.0743 seconds.)

```
DROP TABLE dep;
```

[Edit inline] [Edit] [Create PHP code]

Note:

Table and column names are case-insensitive in most SQL systems.
 Ensure the table dep exists before adding a foreign key to avoid errors.
 Would you like this as a PDF or Word document as well?

Appendix

```
DROP DATABASE lab1;
```
