

Kantipur City College  
Department of Computer Engineering  
Semester IV/ Probability and Statistics  
Lab Sheet No.10

Title: Confidence Interval estimation.

Objectives: To find confidence interval estimate for population mean and proportion.

Theory:

**Confidence interval for population mean:**

$$[\bar{X} \pm Z_{\alpha} \text{ S.E. } (\bar{X})]$$

Where,

$$\text{S.E } (\bar{X}) = \frac{\sigma}{\sqrt{n}} \quad \text{if population is infinite.}$$

$$\text{S.E } (\bar{X}) = \frac{\sigma}{\sqrt{n}} \sqrt{\frac{N-n}{N-1}} \quad \text{if population is finite.}$$

**Confidence interval for population proportion:**

$$[p \pm Z_{\alpha} \text{ S.E. } (p)]$$

Where,

$$\text{S.E } (p) = \sqrt{\frac{pq}{n}} \quad \text{if population is infinite.}$$

$$\text{S.E } (p) = \sqrt{\frac{pq}{n}} \sqrt{\frac{N-n}{N-1}} \quad \text{if population is finite.}$$

Lab work:

1. A random sample of 50 gave a mean of 7.5 kg and standard deviation of 1.5 kg. Find 95% and 99% confidence limit for the population mean.

Using Excel:

|    | A                                               | B                     | C                  |
|----|-------------------------------------------------|-----------------------|--------------------|
| 1  | <b>Data</b>                                     |                       | <b>Formula</b>     |
| 2  | n=                                              | 50                    |                    |
| 3  | sample mean=                                    | 7.5                   |                    |
| 4  | sample standard deviation=                      | 1.5                   |                    |
| 5  | confidence coefficient (1- $\alpha$ )=          | 0.95                  |                    |
| 6  | $\alpha$ =                                      | 0.05                  | =1-B5              |
| 7  | $\alpha/2$ =                                    | 0.025                 | =B6/2              |
| 8  | $z_{\alpha/2}$ =                                | 1.959963985           | =ABS(NORMSINV(B7)) |
| 9  | Standard error of mean=                         | 0.212132034           | =B4/SQRT(B2)       |
| 10 |                                                 |                       |                    |
| 11 | <b>Calculation of 95% C.I for mean:</b>         |                       |                    |
| 12 | Lower confidence limit=                         | 7.084228853           | =B3-B8*B9          |
| 13 | Upper confidence limit=                         | 7.915771147           | =B3+B8*B9          |
| 14 |                                                 |                       |                    |
| 15 | Hence required 95% confidence limit for mean is | (7.0842289,7.9157711) |                    |

2. From a population of 540, a sample of 60 individuals is taken. From this sample, the mean is found to be 6.2 and standard deviation 1.368. Construct 98% confidence interval for the mean.

Using Excel:

|    | A                                       | B        | C                                 |
|----|-----------------------------------------|----------|-----------------------------------|
| 1  | <b>Data</b>                             |          | <b>Formula</b>                    |
| 2  | n=                                      | 60       |                                   |
| 3  | N=                                      | 540      |                                   |
| 4  | sample mean=                            | 6.2      |                                   |
| 5  | sample standard deviation=              | 1.368    |                                   |
| 6  | confidence coefficient (1- $\alpha$ )=  | 0.95     |                                   |
| 7  | $\alpha$ =                              | 0.05     | =1-B5                             |
| 8  | $\alpha/2$ =                            | 0.025    | =B6/2                             |
| 9  | $z_{\alpha/2}$ =                        | 1.959964 | =ABS(NORMSINV(B7))                |
| 10 | Standard error of mean=                 | 0.166662 | =B5/SQRT(B2)*SQRT((B3-B2)/(B3-1)) |
| 11 |                                         |          |                                   |
| 12 | <b>Calculation of 95% C.I for mean:</b> |          |                                   |
| 13 | Lower confidence limit=                 | 5.873348 | =B4-B9*B10                        |
| 14 | Upper confidence limit=                 | 6.526652 | =B4+B9*B10                        |

3. A random sample of 500 oranges was taken from a large consignment and it was observed that 65 were found to be bad. Find 99% confidence interval estimate for the proportion of bad oranges.

Using Excel:

|    | A                                         | B        | C                  |
|----|-------------------------------------------|----------|--------------------|
| 1  | <b>Data</b>                               |          | <b>Formula</b>     |
| 2  | n=                                        | 500      |                    |
| 3  | No. of bad oranges(X)=                    | 65       |                    |
| 4  | p=                                        | 0.13     | =B3/B2             |
| 5  | q=                                        | 0.87     | =1-B4              |
| 6  | Standard error of p=                      | 0.01504  | =SQRT(B4*B5/B2)    |
| 7  | confidence coefficient(1- $\alpha$ )=     | 0.99     |                    |
| 8  | $\alpha$ =                                | 0.01     | =1-B7              |
| 9  | $\alpha/2$ =                              | 0.005    | =B8/2              |
| 10 | $z\alpha/2$ =                             | 2.575829 | =ABS(NORMSINV(B9)) |
| 11 |                                           |          |                    |
| 12 | <b>99% C.I. for population proportion</b> |          |                    |
| 13 | Lower confidence limit=                   | 0.09126  | =B4-B10*B6         |
| 14 | Upper confidence limit=                   | 0.16874  | =B4+B10*B6         |

4. A factory is producing 50000 pairs of shoes daily, 500 pairs of shoes are drawn as sample in which 2% were found to be defective. Assign 95% limits within which proportion of defective pair lies.

|    | A                                           | B        | C                                            |
|----|---------------------------------------------|----------|----------------------------------------------|

| 29 | Lower confidence limit=                     | 0.00779  | =B21-B24*B25                                 |
| 30 | upper confidence limit=                     | 0.03221  | =B21+B24*B25                                 |

Assignments;

1. If sample mean is 20, population standard deviation is 3 and the sample size is 64, find the interval estimate of the population mean. ( $\alpha=5\%$ )
2. In a sample survey of 1000 housewives in a city 23% prefer a particular brand of pressure cooker. Find 99% confidence limits for the percentage of all housewives in the city preferring that brand of pressure cooker.
